University-level research indicates that the new Java Cushion is better than the competition by every measure:

• Lower pressures
• Greater sitting stability
• Less deep tissue deformation
• Cooler and dryer
Better by every measure.

Just like the Ride Custom Cushion, the Ride Java® Cushion works by redistributing the forces of pressure and shear away from high risk areas, while selectively applying the forces to areas more tolerant. The Java Cushion’s design and cover materials help to maintain cool, dry skin. The result is the potential for:

- Lower pressures and, thus, less deep tissue distortion to help decrease deep tissue injury and the potential for severe pressure sores (Stages III and IV)
- Decreased heat and moisture to aid in the prevention of superficial pressure sores (Stages I and II)

Monitor the sitter’s status, not the cushion

The Java Cushion offers enhanced sitting performance without the need for regular fit-essential maintenance — unlike the ongoing adjustments required to maintain fluid or air volumes in competitive cushion designs.

If users experience a change in their general condition, the Java Cushion can most often be adjusted, using Ride CAM® wedges, to restore its original effectiveness.

Good question: Ride Java or Custom?

Both cushions employ the same method of support and are appropriate choices for all levels of skin risk. The Java Cushion, however, performs better for people who can sit in relatively good posture or who have mild postural challenges. Those people with more severe postural challenges and/or unique body shapes should consider the Ride Custom Cushion.

Really lightweight

30% lighter!

Performance need not be compromised to enjoy significantly lighter cushion weight and the possibility of enhanced mobility!

*16 x 16” Java Cushion weighs 2.75 lbs, as compared to a 16 x 16” air cushion, weighing in at 3.9 lbs.

Lower Extremity Support

Optional medial (a) and lateral (b) thigh support accessories are interchangeable. Use between the legs to reinforce the medial thigh contour, or on one side of the legs to create a lateral thigh support. Simply configure the accessories to achieve the desired lower extremity alignment, then trim to fit.

Heat and moisture management

A vented base design, contoured top foam, and a breathable spacer mesh fabric cover (detail at right) work together to help keep skin cool and dry.

Adjustable and Adaptable

The skin protection qualities of the Java Cushion can be adjusted through the use of Ride CAM® wedges and well inserts.

The skin protection qualities of the Java Cushion can be adjusted through the use of Ride CAM® wedges and well inserts.

Ride CAM wedges adjust the cushion for ischial clearance. Insert wedge(s) as needed, then trim them flush with cushion base.

No wedges.

One wedge on each side.

Two wedges each side.

No wedge on left, two on right.

One wedge on left, two on right.

The CAM wedges can also be used in asymmetry to help correct flexible and correctable pelvic obliquities. Insert wedge(s) as needed, then trim flush with cushion base.

Ride Designs® and its inhouse Aspen Seating Clinic have been successfully using their patented cushion design to help improve posture and skin health for wheelchair users for nearly two decades.

Read on to learn more about the unique and evidence based method of support Ride® employs in all of their seating systems.

Re-think seating strategies

Wheelchair cushion design has historically focused on providing bony prominence immersion and envelopment—into materials such as air, fluid, gel, and specialized foam—to distribute the forces of support over as much contact area as possible. Recent research supports the importance of decreasing deep tissue distortion at high risk anatomic areas to help prevent deep tissue injury and subsequent pressure sores.

A viable alternative to the pressure distribution model is the use of orthotic and prosthetic principles in the design and construction of wheelchair cushions. Ride’s approach is to redistribute the forces of pressure and shear from high risk anatomic areas while selectively applying the forces to areas more tolerant. Review the recent university-level studies on these next few pages and draw your own conclusions.

Interface Pressure Mapping

Interface Pressure Characteristics of an Orthotic Off-Loading Cushion Design

Authors:
Barbara Crane, PhD, PT, ATP/SMS
Evan Call, MS, CSM (NRM)
Michael Wininger PhD

Methodology: Ten subjects, all with SCI, Paraplegia. Nine males, one female, average age 45 years, average time since onset was 20 years. Interface pressure measurements were performed using the Xsensor pressure mapping system. Five 2-minute trials were completed with each cushion and cushions were completely unweighted between trials.

Objective: Compare interface pressure mapping (IPM) dispersion index between Java® Cushion (three different configurations) and a properly inflated air cushion. Dispersion index (DI) is the sum of pressure distributed over the IT and sacral regions divided by the sum of pressure readings over the entire interface pressure mat, expressed as a percentage.

Result: Interface pressure mapping results indicate effective “off-loading” of Ride Java Cushion. The dispersion index is significantly lower on the Java Cushion compared to air cushion, particularly among chronic SCI subjects. This means that a significantly lesser amount of the total forces of support are being experienced at the ischial tuberosities and the coccyx sacral areas.

The lower the dispersion index, the lower the percentage of body weight being borne through the ITs, coccyx and sacrum.

Authors:
Barbara Crane, PhD, PT, ATP/SMS
Evan Call, MS, CSM (NRM)
Michael Wininger PhD

**Ride Designs provided research materials for testing, subject reimbursement, and logistical support.

Two recent university-level research studies provide compelling evidence in support of Ride Designs’ off-loading philosophy.

Properly-inflated air cushion
Problem: columns of air lack the stability needed for postural control, and peak pressures tend to be at the high risk bony prominences, especially the ischial tuberosities (a).

Java Cushion
Solution: Safe and stable support of low risk areas and off-loading of high risk areas:
- Ischial Tuberosities (ITs)
- Greater Trochanters
- Coccyx/Sacrum
- Perineum(Groin)

The lower the dispersion index, the lower the percentage of body weight being borne through the ITs, coccyx and sacrum.

Dispersion Index (%), P<0.001

**MRI Deep Tissue Deformation**

Off Loading Wheelchair Cushion provides best case reduction in tissue deformation as indicated by MRI

**Authors:**
- Evan Call MS, CSM*
- Thomas Hetzel PT, ATP*
- Chad Nelson

**Methodology:** Ten subjects, all with SCI, Paraplegia. Average time since onset was 18.4 years, with most recent being three years, and longest being 30 years.

**Objective:** Compare deep tissue deformation below the ITs and surrounding the femoral head under three conditions: 1) fully suspended, 2) properly-inflated air cushion, 3) Java Cushion.

**Result:**
- Use of the Java Cushion results in nearly 50% less tissue compression at the ischial tuberosities than on a properly-inflated air cell cushion.

**Methodology:**
- Use of the Java Cushion resulted in nearly 50% less tissue compression at the ischial tuberosities compared to the Java Cushion as evidenced by significantly increased functional reach both to the left and right.

**Dramatic Results...**

**Lower Pressures**
- Significantly lower pressures were noted in the region of the ischial tuberosities, coccyx and sacrum.

**Greater sitting stability and function**
- While conducting the pressure mapping study, Dr. Crane also measured sitting stability and discovered improved sitting stability on the Java Cushion as evidenced by significantly increased functional reach both to the left and right.

**Lower tissue distortion**
- Use of the Java Cushion resulted in nearly 50% less tissue compression at the ischial tuberosities than on an air cell cushion.

**Cooler and dryer**
- In a pilot study comparing the cooling abilities of the Java Cushion design to an air cell cushion, Evan Call of Weber State University documented Java Cushion’s superiority in managing heat and moisture.

General Specifications
HCPC code: E2624
Weight capacity: 300 lbs.
Weight: 16 x 16, 2.75 lbs
Limited Warranty: Two Years
Base material: Polyethylene
Top foam: Polyurethane

Optional Accessories
- Reticulated Foam Well Insert Kit
- Ride CAM® Wedge Kit
- 1" Lateral Thigh Support Wedge (pair)
- 1" Medial Thigh Support Insert (pair)
- 1" Cushion Orientation Wedge
- Extra Cushion Cover

Don’t forget a back support!
The Java Cushion works best when paired with a Ride Java® Back. Other back supports are flat from top to bottom, making accurate fit virtually impossible. The Java Back’s patented biomechanical design provides flexibility to accurately fit the trunk and pelvis for superior support, comfort, and mobility. Install and fit—in less time than it takes to drink your half-caff-double-tall-nonfat-extra-foamy latte! The Java Back’s highly adjustable, quick release, dynamic hardware makes for a quick fit and ease of daily use. Three heights and two depths are available in each width.
